---

1. Overview & History

Reed-Kellogg diagramming was developed by **Alonzo Reed** and **Brainerd Kellogg** in the 1870s, formalized in their 1877 textbook *Higher Lessons in English*. It remains the dominant structural visualization method for English grammar in American education.

The system represents sentences as a **hierarchical spatial layout** where:

- Horizontal lines carry core grammatical elements (subject, verb, object/complement)
- Diagonal and vertical lines represent relationships and dependencies
- Position encodes grammatical function, not just word order

---

2. Core Visual Grammar

2.1 Line Types and Their Meanings

```
────────────────────────  Horizontal baseline: carries main clause elements
        |                 Vertical full line: separates subject | verb (or verb | object)
       /                  Diagonal slant line: modifier attached below the word it modifies
      ---                 Short horizontal under slant: holds the modifier word
    - - - - -             Dashed horizontal line: connects subordinate clause to its antecedent
       ╱                  Diagonal from baseline: indirect object, predicate complement fork
```

2.2 Spatial Hierarchy

```
MAIN CLAUSE always occupies the topmost baseline.
    │
    ├── Modifiers hang BELOW on slant lines
    │
    ├── Subordinate clauses occupy LOWER baselines
    │       └── connected to antecedent by dashed line
    │
    └── Compound elements fork with stepped lines connected by conjunction on dotted vertical
```

---

3. The Baseline System

3.1 Main Clause Baseline

The main baseline is a long horizontal line divided by two vertical marks:

```
subject | verb | object/complement
_____________________________________
```

- **First vertical bar** (full height, crosses baseline): separates subject from verb
- **Second vertical bar** (half height, sits ON baseline, does not cross): separates verb from object or complement

```
ASCII Representation:

    man  |  runs  |  race
_____________________________________
```

3.2 Linking Verb with Predicate Noun/Adjective

The predicate noun or adjective after a linking verb is separated by a **diagonal line leaning BACK toward the subject** (not a vertical bar):

```
    man  |  is  ╲  teacher
_____________________________________
```

The backward diagonal signals that the complement refers back to the subject.

3.3 Intransitive Verb (No Object)

```
    man  |  runs
_____________________________________
```

No second divider needed when there is no object or complement.

---

4. Parts of Speech — Classification Rules

4.1 Master POS Tag Reference

Tag	Full Name	Definition	Examples
NOUN	Noun	Person, place, thing, idea	man, city, freedom
VERB	Verb	Action, state, occurrence	runs, is, seems
ADJ	Adjective	Modifies a noun or pronoun	tall, red, ancient
ADV	Adverb	Modifies verb, adjective, or other adverb	quickly, very, mass
PREP	Preposition	Shows relationship between noun and another element	on, in, of, by
DET	Determiner	Specifies/quantifies a noun	the, a, this, his, every
PRON	Pronoun	Replaces a noun	he, she, it, they
REL.PRON	Relative Pronoun	Introduces relative clause, refers back to antecedent	who, which, that, whom
CONJ	Coordinating Conjunction	Joins equal grammatical elements	and, but, or, nor, &
SUB.CONJ	Subordinating Conjunction	Introduces subordinate clause	because, although, when, if
PART	Particle	Verb modifier that is not a preposition	up (in "give up")
INTJ	Interjection	Exclamatory word, not grammatically integrated	oh, wow, hey
AUX	Auxiliary Verb	Helping verb supporting main verb	is, was, have, will, can

4.2 Critical Disambiguation Rules

NOUN vs. ADV (e.g., "mass")

- If the word directly precedes a verb and modifies HOW the action is performed → **ADV**
- If the word is the subject, object, or predicate complement → **NOUN**
- Test: Can you replace it with "quickly" or "extensively"? → ADV
- Example: "mass doxxing" — "mass" answers "how?" → **ADV**

DET vs. PRON (e.g., "his")

- If followed by a noun it specifies → **DET** (his space)
- If standing alone, replacing a noun → **PRON** (the space is his)

PREP vs. PART (e.g., "on")

- If followed by a noun phrase it governs → **PREP** (lying on everyone)
- If fused with the verb to form an idiom → **PART** (move on, give up)

REL.PRON vs. PRON

- If introducing a clause that modifies an antecedent noun → **REL.PRON** (who, which, that)

- If standing in place of a noun as subject or object → **PRON**

AUX vs. VERB

- "is/was/were/have/had/will" standing alone as main verb → **VERB**
- "is/was/were/have/had/will" + another verb form → the standalone form is **AUX**, the main form is **VERB**
- Example: "is doxxing" → "is" = AUX, "doxxing" = VERB (present participle)

---

5. Simple Sentences

5.1 Subject — Verb

```
Sentence: "Birds fly."

 Birds | fly
```

5.2 Subject — Verb — Direct Object

```
Sentence: "The man reads books."

 man  | reads | books
 ──────────────────────────────
  |
 the
```

"The" hangs on a diagonal slant beneath "man."

5.3 Subject — Linking Verb — Predicate Noun (PN)

```
Sentence: "He is a teacher."

 He  | is ╲ teacher
 ──────────────────────────────
            |
            a
```

5.4 Subject — Linking Verb — Predicate Adjective (PA)

```
Sentence: "She seems tired."

 She | seems ╲ tired
 ──────────────────────────────
```

5.5 Subject — Verb — Indirect Object — Direct Object

The indirect object sits on a horizontal line below the verb, connected by a diagonal:

```
Sentence: "She gave him the book."

  She | gave | book
  ─────────────────────────────────────
            |       |
          him     the
          (on diagonal from verb)
```

```
ASCII Detail:

  She | gave   | book
  ─────────────────────────────────────
          \       |
           him     the
```

---

6. Modifiers

6.1 Single Adjective (modifies noun)

Adjectives hang on a **diagonal slant line beneath the noun** they modify:

```
Sentence: "The tall man runs."

   man   | runs
  ──────────────────────────
    |
  the
   \
  tall
```

Multiple adjectives each get their own diagonal:

```
   man   | runs
  ──────────────────────────
  / |
 the tall
```

6.2 Single Adverb (modifies verb)

Adverbs hang on a **diagonal slant line beneath the verb** they modify:

```
Sentence: "He runs quickly."

   He | runs
  ──────────────────────────
        |
      quickly
```

6.3 Adverb Modifying Adjective or Another Adverb

The adverb hangs beneath the word it modifies, even when that word is already on a slant:

```
Sentence: "He runs very quickly."

 He | runs
────────────────────────────────
       |
    quickly
       |
     very
```

6.4 Pre-verb Adverb (e.g., "mass" before "doxxing")

When an adverb precedes the verb it modifies (as in "mass doxxing"), it still attaches **below and under the verb**, positionally toward the left side of the verb's line segment to reflect its pre-verb surface position:

```
man | is doxxing
──────────────────────────────────
      |
    mass ← positioned left-center under "doxxing"
```

Rule: The slant always originates from directly beneath the modified word, regardless of the adverb's surface position in the sentence. The left-lean of the attachment reflects its pre-modifier nature.

---

7. Compound Structures

7.1 Compound Subject

Two subjects joined by a conjunction use a **forked baseline** with conjunction on a dotted vertical between them:

```
Sentence: "Dogs and cats run."

 Dogs ─┐
       ├── ...and... | run
 cats ─┘
```

```
ASCII Detail:

 Dogs ──────────┐
  · · and · · │──| run ──────────────────
 cats ──────────┘
```

The conjunction sits on a **short dotted vertical line** connecting the two subject branches.

7.2 Compound Predicate (Most Important for Tooling)

Two or more verbs sharing the same subject:

```
Sentence: "He runs and jumps."

          runs ──────────────
 He | ·····&·····
          jumps ─────────────
──────────────────────────────────────
```

Critical Rules for Compound Predicates:

1. The subject connects to a **vertical divider**
2. From that divider, **stepped horizontal lines** branch upward and downward for each predicate
3. The **conjunction** sits on a **short dotted vertical** connecting the two predicate lines
4. **Any shared auxiliary verb** (like "is") should appear on **BOTH branches**, not just one

7.2.1 Shared Auxiliary in Compound Predicate

```
Sentence: "This man is mass doxxing & lying on everyone."

                VERB
          ┌── is doxxing ──────────────────────────
man  |  ···&···
          └── is lying ──────────────────────────
──────────────────────────────────────────────────────────────────────
                |
              mass (under "doxxing," left-center)

          (from "lying" branch:)
              └── on ── everyone
```

Rule: When one auxiliary governs two progressive verbs ("is doxxing & [is] lying"), the auxiliary must be **explicitly shown on both branches**. Omitting it from the second branch incorrectly implies the second verb is bare infinitive.

7.3 Compound Object

```
Sentence: "She reads books and articles."

She  |  reads  |─┐ books
                  ├── ···and···
                  └─ articles
```

7.4 Compound Sentence (Two Independent Clauses)

Two full baselines connected by a conjunction on a dotted vertical or a semicolon on a solid vertical:

```
Sentence: "He runs and she swims."

He  |  runs
──────────────────
   ···and···  (dotted vertical connector between the two baselines)
──────────────────
She  |  swims
```

---

8. Phrases

8.1 Prepositional Phrase

A prepositional phrase consists of a **preposition + noun phrase**. It attaches below the word it modifies.

As adjective (modifying noun):

```
Sentence: "The man in the room left."

  man  |  left
 ──────────────────────────────────────
   |
  the
   \
   in ── room
         |
        the
```

As adverb (modifying verb):

```
Sentence: "She ran into the store."

  She  |  ran
 ──────────────────────────────────────
         |
        into ── store
                  |
                 the
```

Visual structure of a prepositional phrase:

```
      (word being modified)
            |
           prep
           ──────── (short horizontal)
           object of prep
            |
       (any modifiers of object)
```

8.2 Nested Prepositional Phrases

```
Sentence: "lying on everyone who enters his space"

 lying
   |
  on ──── everyone
            |
        (relative clause connector — see §9.2)
```

8.3 Participial Phrase (modifies noun)

Participial phrases act as adjectives and hang below the noun they modify, with the participle on the slant:

```
Sentence: "The man running the race won."

  man  |  won
 ──────────────────────────────────────
   |
  the
   \
  running ─── race
              |
             the
```

8.4 Gerund Phrase (acts as noun)

A gerund phrase occupies a noun slot but sits on a **pedestal** (raised line) to signal it is a verb-form:

```
Sentence: "Running daily is healthy."

    running
    ──────────── | is ╲ healthy
      |
    daily
```

The pedestal line sits above the main baseline when the gerund is the subject.

8.5 Infinitive Phrase

Infinitives ("to + verb") can act as noun, adjective, or adverb:

As noun (subject):

```
    to run
    ──────────── | is ╲ fun
```

As adjective:

```
  desire  |  grew
 ──────────────────────────────────
    |
  to ── run
  (under "desire")
```

---

9. Clauses

9.1 Independent vs. Subordinate Clause

Clause Type	Baseline Level	Connector
Main / Independent	Top (primary)	None needed
Subordinate / Dependent	Below main	Subordinating conjunction on slant, OR dashed line for relative

9.2 Relative Clause

A relative clause modifies a noun in the main clause. It sits on its **own baseline below**, connected by a **dashed**

line from the relative pronoun back to the antecedent noun.

```
Sentence: "the man who runs the company"

  man
──────────────────────────────────────────
   |
 - - (dashed vertical)
   |
  who | runs | company
──────────────────────────────────────────
                |
               the
```

Critical Rules:

1. The dashed line connects from the **relative pronoun** (who/which/that) on the subordinate baseline UP to the **antecedent noun** on the main baseline
2. The relative pronoun serves as the SUBJECT of its own clause
3. "that" can be omitted (zero relative) — the dashed line still connects to the implicit position

"Who" vs. "Whom":

- "who" = subject of relative clause (nominative)
- "whom" = object of relative clause (accusative)
- Diagram placement reflects this function, not surface word order

9.3 Relative Clause on Object of Preposition

```
Sentence: "lying on everyone who enters his space"

 [main verb]
    |
   on ──── everyone
          |
        - - - (dashed)
          |
         who | enters | space
        ──────────────────────────────
                     |
                    his
```

Rule: The dashed connector anchors at the antecedent ("everyone"), even when that antecedent is itself the object of a preposition.

9.4 Noun Clause

A noun clause occupies a noun slot. It sits on a pedestal like a gerund:

```
Sentence: "What he said surprised me."

   what | said
   ──────────────
      | he        ← subject of clause hangs below
 ──────────────────── (pedestal) | surprised | me
```

9.5 Adverb Clause

An adverb clause modifies the main verb and attaches beneath it. The subordinating conjunction sits on the slant line:

```
Sentence: "She left because he arrived."

 She | left
 ──────────────────────────────────────
        |
     because
        |
  he | arrived
 ──────────────────────────────────────
```

---

10. Complex & Compound-Complex Sentences

10.1 Complex Sentence

One independent clause + one or more subordinate clauses:

```
Sentence: "Although it rained, the game continued."

  game | continued
 ──────────────────────────────────────
     |
 although
     |
  it | rained
 ──────────────────────────────────────
```

10.2 Compound-Complex Sentence

Two or more independent clauses + at least one subordinate clause:

```
Sentence: "He left early, and she stayed because she wanted to."

  He | left          she | stayed
 ──────────────────────── ···and··· ──────────────────────
                              |
                           because
                              |
                          she | wanted
                          ──────────────────────
                                |
                           to (infinitive)
```

---

11. Special Constructions

11.1 There / Expletive Construction

"There" as an expletive (not an adverb of place) sits on a horizontal below the subject, labeled as expletive:

```
Sentence: "There are three dogs."

  dogs  |  are
 ------------------------------------
   |        |
 three   There (expletive, below baseline on horizontal)
```

11.2 Passive Voice

The passive agent ("by + noun") attaches as a prepositional phrase below the verb:

```
Sentence: "The cake was eaten by him."

  cake  |  was eaten
 ------------------------------------
   |          |
  the        by —— him
```

11.3 Appositive

An appositive renames a noun and sits in parentheses beside it on the same baseline:

```
Sentence: "My friend, the doctor, left."

  friend (doctor)  |  left
 ------------------------------------
     |
   My
```

11.4 Absolute Phrase

An absolute phrase has no grammatical connector to the rest of the sentence. It floats on its own short baseline connected by a dotted line to the main clause:

```
Sentence: "The work finished, she left."

  she  |  left
 ------------------------------------
- - - - (dotted) - - - - -
  work  |  finished
 ------------------------------------
    |
  The
```

11.5 Coordinating Conjunction Joining Non-Parallel Elements

When "&" or "and" joins two different grammatical forms (rare), flag this as a structural irregularity. Ideal input sentences have parallel structure.

11.6 Vocative / Direct Address

A noun of direct address (vocative) floats above the main baseline on its own short line:

```
Sentence: "John, come here."

    John
  ──────────── (floating, no connector)
 (you) | come
──────────────────────────────────────
          |
        here
```

---

12. Punctuation & Conjunctions

12.1 Coordinating Conjunctions (FANBOYS + &)

Word	Tag	Visual Placement
for	CONJ	Dotted vertical between joined elements
and	CONJ	Dotted vertical between joined elements
nor	CONJ	Dotted vertical between joined elements
but	CONJ	Dotted vertical between joined elements
or	CONJ	Dotted vertical between joined elements
yet	CONJ	Dotted vertical between joined elements
so	CONJ	Dotted vertical between joined elements
&	CONJ	Dotted vertical between joined elements

Critical: "&" must ALWAYS be tagged CONJ, never PUNCT. It functions identically to "and."

12.2 Correlative Conjunctions

Both parts appear on dotted verticals framing each element:

```
both ··· and ···
either ··· or ···
neither ··· nor ···
not only ··· but also ···
```

12.3 Subordinating Conjunctions (Partial List)

These introduce adverb clauses and sit on the slant line connecting the subordinate baseline:

```
after, although, as, as if, because, before, even though,
if, in order that, once, since, so that, though, unless,
until, when, whenever, where, wherever, while
```

12.4 Punctuation in Diagrams

- **Periods, commas, exclamation marks, question marks:** Generally omitted from diagrams
- **Semicolons:** Shown as a vertical bar on the dotted line connecting two independent clauses
- **Colons:** Rarely diagrammed; treat what follows as an appositive or separate structure

13. Common Errors & Disambiguation Rules

13.1 Top 10 Diagramming Errors

#	Error	Correct Rule
1	Placing auxiliary only on first compound verb branch	Auxiliary must appear on ALL branches it governs
2	Tagging pre-verb modifiers (like "mass") as NOUN	Test: does it modify the verb? → ADV
3	Tagging "&" as PUNCT	"&" is always CONJ
4	Attaching PP to wrong verb in compound predicate	Attach PP to the verb it semantically modifies
5	Relative clause connected to wrong antecedent	Dashed line goes to the NEAREST logical antecedent noun
6	Placing modifier on right end of verb line instead of under modified word	Modifier slant originates directly beneath the word it modifies
7	Treating predicate noun after linking verb as direct object (vertical bar instead of diagonal)	Use backward diagonal for predicate nominative/adjective
8	Missing "understood you" subject in imperative sentences	Diagram "(you)" as subject in parentheses
9	Losing parallel structure in compound predicates	Both branches must be grammatically equivalent forms
10	Collapsing relative clause into prepositional phrase	Relative clauses always get their own baseline with dashed connector

13.2 Present Progressive Compound Predicate (Key Pattern)

Sentence: "He is doxxing & lying."

```
Correct analysis:
- "is" = shared auxiliary governing BOTH verbs
- "doxxing" = present participle (main verb, branch 1)
- "lying" = present participle (main verb, branch 2)
- Both branches should read: "is doxxing" / "is lying"
- NOT: "is doxxing" / "lying"
```

Why this matters for tooling: NLP tokenizers may assign "is" to only the first VP token span. Your tool must detect AUX + VERB[pres.part] patterns and propagate the auxiliary to all conjoined participial branches.

13.3 "Who" Entry Point into Relative Clause

"Who" functions as the SUBJECT of its relative clause. Do not treat it as merely a connector word — it must appear on the left side of the relative clause baseline as the subject:

```
WRONG:  ——— everyone ——— who enters his space (flat)
RIGHT:  ——— everyone
            │ (dashed)
          who | enters | space
```

13.4 Modifier Position Encoding

When an adverb precedes its verb (pre-verbal position), the slant line should lean left-ward beneath the verb to signal pre-verbal attachment:

```
mass [doxxing]
  ↑ pre-verbal adverb

Diagram:
  is doxxing
    /
   mass  ← left-center beneath "doxxing"
```

When an adverb follows its verb (post-verbal position), the slant leans toward the right:

```
[runs] quickly
  ↑ post-verbal adverb

Diagram:
  runs
    \
   quickly  ← right-center beneath "runs"
```

---

14. POS Tagging Decision Trees

14.1 Is this word a NOUN or ADV?

```
Does the word modify a verb, adjective, or other adverb?
        |
      YES → ADV
        |
      NO
        |
Does the word name a person, place, thing, or idea?
        |
      YES → NOUN
        |
      NO → Consider ADJ, DET, or other
```

14.2 Is this word a VERB (main) or AUX?

```
Is it followed by another verb form (participle, infinitive)?
        |
      YES → AUX (it's helping)
        |
      NO
        |
Is it the only verb in the clause?
        |
      YES → VERB (main)
        |
      NO → Context-dependent; check for compound predicates
```

14.3 Is this word a PREP or PART?

```
Is it followed by a noun phrase it governs?
    |
    YES → PREP ("on everyone")
    |
    NO
    |
Is it fused with the verb to form a phrasal verb idiom?
    |
    YES → PART ("give up," "move on")
    |
    NO → Re-examine; may be ADV
```

14.4 Is this "who/which/that" a REL.PRON or CONJ?

```
Does it introduce a clause that modifies a preceding noun?
    |
    YES → REL.PRON (relative clause)
    |
    NO
    |
Does it introduce a noun clause (subject/object position)?
    |
    YES → CONJ (complementizer) or REL.PRON (still, by convention)
    |
    NO → PRON (interrogative or other use)
```

---

15. Quick Reference Card

15.1 Line Symbol Glossary

Symbol	Meaning
═══	Baseline (subject / verb / object line)
|	Full vertical — separates subject from verb
/ half-height	Short vertical — separates verb from object
\ backward diagonal	Predicate nominative / adjective separator
\ or / slant	Modifier attachment line
- - - dashed	Relative clause connector to antecedent
· · · dotted vertical	Conjunction connector between compound elements
( ) parentheses	Appositive or implied/understood element

15.2 Baseline Occupants by Slot

Position	What Goes Here
Left of first vertical	Subject (noun, pronoun, gerund phrase, noun clause)
Between verticals	Verb (+ any auxiliaries)
Right of second vertical	Direct object OR predicate noun/adjective
Below subject	Subject modifiers (det, adj, participial phrase)
Below verb	Verb modifiers (adv, prepositional phrase as adv)
Below object	Object modifiers (adj, prepositional phrase as adj)
Separate lower baseline	Subordinate clause (relative, adverb, noun clause)

15.3 Compound Predicate Checklist

When diagramming a compound predicate, verify:

- [ ] Subject connects to a single vertical divider
- [ ] Both verb branches fork from that divider
- [ ] Conjunction sits on dotted vertical between branches
- [ ] Shared auxiliary appears on **both** branches
- [ ] Adverb modifiers attach beneath the correct verb branch only
- [ ] Prepositional phrases attach to the semantically correct verb branch only
- [ ] Each branch has equal visual weight (parallel structure preserved)

15.4 Relative Clause Checklist

When diagramming a relative clause, verify:

- [ ] Relative clause has its own full baseline below main clause
- [ ] Dashed line connects REL.PRON to antecedent noun (not to clause boundary)
- [ ] REL.PRON occupies subject or object slot in its own clause
- [ ] If antecedent is object of preposition, dashed line still reaches the noun directly
- [ ] Relative clause baseline labels SUBJECT, VERB, and OBJECT/COMPLEMENT
- [ ] "that" (zero relative) is noted even if not surface-present

---

Appendix A: Sentence Type Identifier

Sentence Pattern	Key Signal	Diagram Structure
Simple	One subject, one predicate	Single baseline
Compound	Two independent clauses	Two baselines, dotted connector
Complex	One main + one subordinate	Main baseline + lower subordinate
Compound-Complex	Two+ main + one+ subordinate	Multiple baselines, mixed connectors
Imperative	No explicit subject	(you) as implied subject in parentheses
Exclamatory	Interjection or inverted order	Interjection floats above; restructure to normal order

Sentence Pattern	Key Signal	Diagram Structure
Passive	"be" + past participle	Past participle as main verb; agent in PP below

---

Appendix B: Verb Form Reference

Verb Form	Tag	Example	Auxiliary Needed
Simple present	VERB	runs	No
Simple past	VERB	ran	No
Present progressive	AUX + VERB	is running	Yes ("is")
Past progressive	AUX + VERB	was running	Yes ("was")
Present perfect	AUX + VERB	has run	Yes ("has")
Past perfect	AUX + VERB	had run	Yes ("had")
Future	AUX + VERB	will run	Yes ("will")
Modal	AUX + VERB	can run, might run	Yes (modal)
Passive (simple)	AUX + VERB	is eaten	Yes ("is/was")
Passive (perfect)	AUX + AUX + VERB	has been eaten	Yes (both)

Tooling Note: For compound predicates involving progressive forms, always check whether the auxiliary is shared across all conjoined verbs. If so, propagate it explicitly to each branch in the diagram.

Appendix C: Sample Full Diagram Walkthrough

Sentence: "This man is mass doxxing & lying on everyone who enters his space."

Step 1 — Tokenize and Tag:

Token	POS	Rationale
This	DET	Specifies "man"
man	NOUN	Subject
is	AUX	Auxiliary for both "doxxing" and "lying"
mass	ADV	Pre-verbal adverb modifying "doxxing" (answers "how?")
doxxing	VERB	Present participle, branch 1 of compound predicate
&	CONJ	Coordinates "doxxing" and "lying"
lying	VERB	Present participle, branch 2 of compound predicate
on	PREP	Introduces PP modifying "lying" specifically
everyone	PRON	Object of "on"
who	REL.PRON	Subject of relative clause modifying "everyone"
enters	VERB	Main verb of relative clause
his	DET	Specifies "space"
space	NOUN	Direct object of "enters"

Step 2 — Identify Structures:

- Main clause: "man | is [doxxing & lying]"
- Compound predicate: "is doxxing" + "is lying" (shared aux)
- Adverb modifier: "mass" → "doxxing"
- Prepositional phrase: "on everyone" → modifies "lying"
- Relative clause: "who enters his space" → modifies "everyone"
- Determiner: "This" → "man"; "his" → "space"

Step 3 — Final Diagram:

```
                VERB          VERB
          ┌──────── is doxxing ──────────────────────
man  |    · & ·
          └──────── is lying ──────────────────────
──────────────────────────────────────────────────────────────
|              |       |
This          mass(/)   on ─── everyone
          (under doxxing,   (from "lying")   |
           left-center)              - - (dashed)
                                     |
                                  who | enters | space
                                  ──────────────────────
                                     |
                                    his
```
